## EXPERIENCE

---

### IT Application Development Intern

Avon, MN

*Blattner Company - Renewable Energy*

*Apr. 2025 - Current*

- Developed a PyQt6-based desktop application for Blattner IT that **automates** iPhone and iPad shipping form creation, **reducing data entry** by pre-populating validated ServiceNow ticket information into FedEx shipping PDFs, which saves approximately 120 hours of labor each year (~\$2,000 to \$2,500/year).
- Designed and implemented a **multi-stage validation** engine with auto-ticket triage and failures flagged by rule (site code missing, home address shipping, device type unsupported, etc.), and approved tickets routed into site group-based shipment queues for label generation.
- Prevented an estimated **\$4,800–\$20,000+** in annual accessory over-provisioning costs by enforcing device-aware accessory logic tied to Blattner's ongoing Lightning-to-USB-C transition, eliminating mismatched or redundant hardware shipments at scale.

### Software Engineering Intern

St. Cloud, MN

*Obsidian Code - EdTech solutions provider*

*May 2023 - Dec. 2023*

- Played a key role in enhancing the **front-end** architecture for the platform used to track student attendance, grades, and other administrative data for Minnesota state schools.
- **Leveraged** React & Tailwind to build a scalable, reusable frontend, cutting future design **costs** indefinitely and ensuring long-term **modularity**.
- Modernized the UI/UX, increasing sales leads by ~**20%** with an industry-standard design that received unanimous staff approval and was tailored to client needs.
- Delivered a **scalable**, maintainable solution now successfully deployed across multiple school systems across Minnesota.
- Leading migration of a legacy codebase to a modern React framework, improving **maintainability**, **scalability**, and long-term **adaptability**.

## EDUCATION

---

### Saint Cloud State University

St. Cloud, MN

*BSE in Software Engineering - GPA: 3.62*

*August 2023 - May 2027*

- **Organizations:** Computer Science Club & Student Organization for Software Engineers.

## PROJECTS

---

### NBA Player Anomaly Detection & Performance Forecaster: A Machine Learning Engine - [Github](#)

- Built a real-time NBA player performance forecasting engine that ingests live game data, engineers time-series features, and trains an XGBoost model to predict next-game output.
- Implemented dual anomaly detection (Z-score + Isolation Forest) to flag statistically unusual performances and exposed everything via a REST API with three live endpoints.
- Delivered a full production-quality system with an interactive Streamlit dashboard, automated test suite, and CI/CD pipeline through GitHub Actions.

### Today I Learned: Daily Fun Facts! - [Demo](#) | [Github](#)

- Developed a **full-stack** web application using **React** and Supabase RESTful API, where users can post and vote on interesting facts by category.
- Implemented **real-time** data fetching and dynamic UI updates with React hooks and component-based architecture.
- Applied responsive CSS styling and integrated a **cloud-hosted** database backend for persistent data storage and retrieval.

## SKILLS

---

**Languages:** JavaScript, TypeScript, HTML, CSS, Python, C++, C#, SQL, R

**Frameworks:** Flask, Next.js, Tailwind, .NET, FastAPI, Streamlit

**Libraries:** React, Pandas, numpy, XGBoost, MLflow, SASS

**Database:** MongoDB, MySQL, Azure

**Dev Tools / Concepts:** DevOps, Figma, GitHub, Node.js, Linux
